

Getting a Dental Crown Procedure: Everything You Need to Know

Dental crowns are a common procedure to restore damaged or decayed teeth. They are also used to improve the appearance of teeth that are discolored, chipped, or misshapen. Dental crowns can be made from a variety of materials, including porcelain, ceramic, and metal. The type of material used will depend on the location of the crown, the amount of damage to the tooth, and the patient's budget.

Types of Dental Crowns

There are several different types of dental crowns, each with its own advantages and disadvantages. The most common types of crowns include:

- **Porcelain crowns** are made from a durable ceramic material that is matched to the color of your natural teeth. Porcelain crowns are a

good choice for teeth that are visible when you smile, as they provide a natural-looking restoration.

- **Ceramic crowns** are made from a type of glass-ceramic material. They are similar to porcelain crowns in terms of durability and appearance, but they are less expensive.
- **Metal crowns** are made from a variety of metals, including gold, silver, and titanium. Metal crowns are very durable and long-lasting, but they are not as aesthetically pleasing as porcelain or ceramic crowns.
- **Zirconia crowns** are made from a type of ceramic material that is extremely strong and durable. Zirconia crowns are a good choice for teeth that are subjected to a lot of wear and tear, such as molars.

The Dental Crown Procedure

The dental crown procedure typically takes two visits to the dentist. During the first visit, the dentist will prepare the tooth for the crown. This involves removing any decay or damage from the tooth and shaping the tooth so that the crown will fit properly. The dentist will then take an impression of the tooth so that the crown can be fabricated.

During the second visit, the dentist will place the crown on the tooth. The crown will be cemented into place and adjusted to ensure a proper fit. The dentist will also check the bite to make sure that the crown is not interfering with the patient's ability to chew or speak.

Recovery from a Dental Crown Procedure

Most patients experience little to no discomfort after a dental crown procedure. However, some patients may experience some sensitivity to hot

or cold temperatures. This sensitivity typically goes away within a few days.

Patients should avoid chewing on hard foods or objects for the first few days after the procedure. This will help to prevent the crown from becoming damaged. Patients should also brush and floss their teeth regularly to keep the crown clean and free of plaque and bacteria.

Benefits of Dental Crowns

Dental crowns offer a number of benefits, including:

- **Restore damaged or decayed teeth**
- **Improve the appearance of teeth**
- **Protect teeth from further damage**
- **Improve oral health**

Dental crowns are a safe and effective way to restore damaged or decayed teeth. They can also improve the appearance of teeth and protect them from further damage. If you are considering a dental crown, talk to your dentist to learn more about the procedure and whether it is right for you.
