

Non-Newtonian Fluids: A Dynamical Systems Approach

Non-Newtonian fluids are a class of fluids that exhibit complex behaviors that deviate from the simple linear relationship between shear stress and shear rate that is characteristic of Newtonian fluids. These fluids are ubiquitous in nature and industry, from the flow of blood in our veins to the processing of food and pharmaceuticals. Understanding the behavior of non-Newtonian fluids is crucial for a wide range of applications, from the design of new materials to the optimization of industrial processes.

Dynamical Systems Approach

This book takes a dynamical systems approach to understanding non-Newtonian fluids. Dynamical systems theory is a powerful mathematical framework that provides a unified way to analyze the behavior of complex systems. By applying dynamical systems theory to non-Newtonian fluids, we can gain a deeper insight into their behavior and identify key parameters that govern their flow properties.

Key Concepts

The book covers a wide range of topics related to non-Newtonian fluids, including:

- The basic concepts of rheology, the study of the flow of fluids
- The different types of non-Newtonian fluids, such as shear thinning, shear thickening, and yield stress fluids
- The use of dynamical systems theory to analyze the behavior of non-Newtonian fluids
- The applications of non-Newtonian fluids in various industries, such as the food, pharmaceutical, and oil and gas industries
